

StockFi Passport

G-Pass NFT Whitepaper v0.1

The First Google-linked StockFi Passport

RWA x NFT x DeFi

Principal Shield · Target Yield Layer · Redeem-to-Exposure

Executive Summary

StockFi Passport is an NFT issuance platform for real-world assets. It is designed to combine stock-linked exposure, a target yield layer, redemption rules and secondary market liquidity into a wallet-native NFT certificate.

G-Pass NFT is the first asset issued by the platform. Users mint one G-Pass with ETH payment valued at 10 USDC, receiving a protocol-mapped Google stock-linked exposure and a 3.5% Target APY layer. Yield is displayed and claimed weekly. Once mint starts, minted G-Pass NFTs can trade on supported secondary markets immediately, while also remaining eligible for Redeem-to-Exposure under platform rules.

Item	Description
Platform	StockFi Passport
First Asset	G-Pass NFT
Reference Asset	Google stock-linked exposure
Total Supply	4,083 NFTs
Mint Price	ETH payment valued at 10 USDC per NFT
Target Yield	3.5% Target APY, claimed weekly
Core Functions	Hold, claim, trade and redeem under platform rules

1. Project Positioning

StockFi Passport is not a single NFT collection. It is an NFT-based stock exposure launchpad. The platform uses NFTs to carry stock-linked exposure, holder status and post-mint actions, allowing users to enter StockFi through wallet-native assets.

- NFT as an on-chain certificate for stock-linked exposure.
- Target Yield Layer for visible and claimable target income.
- Secondary market and redemption paths for improved liquidity.

2. First Asset: G-Pass NFT

G-Pass NFT is the Genesis asset of StockFi Passport and references Google stock-linked exposure. Google is selected as the first reference asset because it has strong global recognition, a clear technology-asset narrative and a low user education barrier.

Item	Description
Product Name	G-Pass NFT
Product Narrative	The first Google-linked StockFi Passport
Issuance Size	4,083 Genesis G-Pass NFTs
Unit Price	ETH payment valued at 10 USDC
Target Yield	3.5% Target APY
Yield Cycle	Claimable once per week
Holder Rights	Hold, claim, trade and redeem

3. User Flow

- User enters the website and connects a wallet.
- User mints G-Pass NFT with ETH payment valued at 10 USDC.
- The system records mint data and maps the NFT to Google stock-linked exposure.
- User views NFT, exposure, accrued yield and claim schedule in the Dashboard.
- User claims yield weekly; once mint starts, minted NFTs can be traded immediately or redeemed under platform rules.

4. Core Mechanisms

4.1 Principal Shield

Principal Shield is the capital-structure design of G-Pass. It combines stock-linked exposure, a yield-support layer and rule-based redemption to improve the holder experience.

4.2 Target Yield Layer

Target Yield Layer is used to display and distribute target yield. The holder Dashboard shows accrued yield based on 3.5% Target APY and supports weekly claiming.

4.3 Redeem-to-Exposure

Redeem-to-Exposure is the redemption path. After redemption is opened, holders can exchange the NFT into the corresponding Google stock-linked exposure under protocol rules.

4.4 Secondary Market

Once mint starts, each minted G-Pass NFT can enter supported NFT secondary markets immediately. Holders can choose to hold, sell or redeem without waiting for the full issuance to close.

5. Capital Flow Model

The key feature of G-Pass is its underlying capital flow. The structure is designed to let users obtain Google stock-linked exposure while also receiving a target annualized yield layer.

Item	Description
User Capital Inflow	User pays the mint fee in ETH, valued at 10 USDC.
Exposure Mapping	The system maps Google stock-linked exposure to each NFT under platform rules.
Yield Support	The yield layer supports weekly claiming based on 3.5% Target APY.
On-chain Certificate	NFT records holder rights, exposure status, yield status and available actions.
Exit Path	Holder can sell on secondary markets or redeem into corresponding exposure under platform rules.

6. Holder Dashboard

The Dashboard is the main interface for managing G-Pass. Holders can view positions, exposure, yield and available actions directly.

- Number of G-Pass NFTs held.
- Corresponding Google stock-linked exposure.
- Accrued claimable yield and next claim time.
- Redeem-to-Exposure status and secondary market entry.

7. Project Highlights

Item	Description
Asset Narrative	From JPEG NFT to financial asset passport.
Real Asset Link	First asset linked to Google stock-linked exposure.
Low Entry Barrier	Mint one G-Pass NFT with ETH valued at 10 USDC.
Yield Visualization	3.5% Target APY, displayed and claimed weekly.
NFT Liquidity	Immediate secondary market trading once mint starts.
Scalable Platform	Future expansion to more stocks, ETFs, indices and RWA assets.

8. Technical Architecture

- Frontend layer: website, wallet connection, mint page and Holder Dashboard.
- Contract layer: NFT minting, holder records, yield claims and transfer status.
- Asset layer: Google stock-linked exposure mapping, price record and redemption status.
- Data layer: price oracle, asset status API and holder data index.
- Market layer: secondary market display, listing and trading entry.

9. Roadmap

Item	Description
Phase 1	Complete website, G-Pass NFT frontend prototype and whitepaper.
Phase 2	Launch G-Pass Genesis Mint and open the Holder Dashboard.
Phase 3	Enable weekly yield claims, immediate secondary market entry after mint starts and holder data display.
Phase 4	Open the Redeem-to-Exposure flow.
Phase 5	Expand to more stock-linked assets and build a multi-asset launchpad.

10. Conclusion

StockFi Passport aims to combine stock-linked exposure, RWA, NFT and DeFi yield structures into a new asset issuance format. G-Pass NFT is the first validation product for this direction, allowing users to access Google stock-linked exposure, target yield claiming and on-chain trading through a single NFT.

If G-Pass succeeds, the platform can expand to more stocks, ETFs, indices and real-world assets, becoming issuance infrastructure for NFT-based stock exposure.

Note: This document is a project concept and product mechanism draft for internal review, website content preparation and external communication refinement.
